

DME API. Sample Service

Sample Service

This is a sample of WCF servicecontract library that consumes **DME API** functionality and can be used in your WEB and Desktop applications.

This service itself contains service and data contracts and configured in the specific host project, **ServiceHostConsole**.

SampleService project includes *App.config* file that contains just one important part, – address binding:

```
...
<baseAddresses>
  <add baseAddress="http://localhost:8732/Design_Time_Addresses/SampleService/Service1"/>
</baseAddresses>
...
```

This address is not used if you configure a host application or a service for this WCF contract library.
